AD FRAUD 2018

14 ways to rob you and the chance to avoid it

DIGITAL AD FRAUD IS HITTING ALL TIME HIGHS

As more money is poured into mobile/online advertising, the incentive to try and steal it grows.

Association of National Advertisers (ANA) says: Digital advertisers lost around $7.2 billion globally to bots in 2016.

Verification company Adloox estimated those losses to reach $16,4B in 2017.

According to TUNE (one of the top marketing platforms) research global app install fraud could be 7.8% and cost marketers up to $2B in 2017.

All the major geos are affected.

Here are main types of traffic anomalies that you can face in 2018.

DEVICE (UP TO 10%*)

- Fake device IDs (user agent, IDFA/Android ID, MAC address, etc.) and their combinations
- Device emulators (BlueStacks, Andy, GenyMotion...)
- Hijacked device – any user's device (browser, phone, app or other system) that has been modified to call HTML or make ad requests that is not under the control of a user and made without the user's consent (ads and redirections are inserted into the user experience by the program running on the device).

IP (UP TO 24%)

- Multiple clicks/conversions from the same IP
- Multiple clicks/conversions from the same IP subnet

PROXY / VPN (UP TO 32%)

- Traffic that is routed through an intermediary proxy device or network where the ad is rendered in a user's device where there is a real human user
- IPs that are associated with known Botnets and Adware
- Users are actively hiding their identity or making conversions from an unwanted GEO

DATACENTER (UP TO 3%)

Traffic originating from servers in data-centers or known cloud platform providers, rather than residential or corporate networks, where the ad is not rendered in a user's device.

OS (UP TO 22%)

Abnormal device distribution within traffic (browser & operating system versions)

ATTRIBUTION (UP TO 12%)

- Click Spamming - App installs previously attributed to clicked ads were discovered to be user-generated app installs randomly claimed by ad networks by spamming the fingerprinting algorithms
- Cookie Stuffing - the process by which a client is provided with cookies from other domains as if the user had visited those other domains. Taking ad tags from a publisher's site and putting them on to another site without the publisher knowledge
- Click Injection (Android only) - Android uniquely vulnerable to click injection fraud, in which an ad network takes credit for organic app installs
- SDK spoofing is the creation of proper-looking installs on real devices without the presence of any actual installs.
